RICE Prioritization Matrix

SYNCOS PRODUCT ROADMAP & RESOLUTION

Applying the RICE framework to our validated hypotheses provides a data-backed roadmap for engineering efforts. Because the baseline telemetry offers exact operational metrics, the **Confidence** variable is exceptionally high, allowing for precise resource allocation.

$$Score = (Reach \times Impact \times Confidence) / Effort$$

Validated Root Causes

PROPOSED FEATURE	REACH	IMPACT	CONFIDENCE	EFFORT	PRIORITY
Predictive Charging Logic (Resolves H4)	**100%** Affects the entire fleet's 24/7 availability	**High** Immediately reclaims peak-hour capacity	**95%** Telemetry explicitly proves the 24% reactive threshold	**Low** Parameter/configuration update in SyncOS	**1 (Highest)**
Proximity-Weighted Routing (Resolves H1)	**100%** Applies to every assigned payload task	**Massive** Directly attacks the 25.7% empty travel cycle time	**90%** Data unequivocally proves FIFO inefficiency	**High** Requires core orchestration algorithm restructuring	**2 (Medium)**
Zone-Based Traffic Corridors (Resolves H3)	**~61%** Affects tasks passing through Dispatch & Aisle 1	**High** Clears the most severe facility deadlocks	**85%** Relies on external compliance with physical site layouts	**Very High** Complex spatial logic + physical facility coordination	**3 (Lowest)**
